

Publisher Optimisation Executive

We are looking for a highly quantitative and technically astute person to work in our publisher management team. You will be responsible for billions of global ad impressions each month, delivered from some of the largest publishing platforms in the world. Your analysis will allow us to improve our margins, increase our volumes faster, and build new functionality into our core engine.

We are looking for somebody with...

- Strong analytic and numerical skills. You'll need to show that you enjoy working with numbers, and can use large datasets to investigate patterns and problems.
- An interest in the technical side of our business. You will not be part of the engineering team. However, you will need to work closely with them, to turn some of your ideas into practice. Ideally, you'll have some experience programming and working with databases.
- Responsibility in a live environment. You will be responsible for the day-to-day results from one or two key exchanges, and need to thrive in an environment with near-term pressures and responsibilities.
- A willingness to work in a very international environment. You'll be part of a global team working with colleagues in offices across Europe and the US.

This is a very fast-paced and innovative start-up environment where you'll quickly play a central role within the business.

You are likely to have an outstanding academic record, and a quantitative degree (science, maths, engineering, etc) at one of the best universities in your country.

Location: London (preferred) or Paris.
